Metals are heated and then mixed to create alloys. However after they undergo rapid cooling they may not remain homogeneous. Often they exhibit undesirable properties including nucleation and spinodal decomposition.

Nucleation and Spinodal Decomposition

Nucleation Region stable, disconnected, bubblelike patterns

Nucleation and Spinodal Decomposition

Nucleation Region stable, disconnected, bubblelike patterns Spinodal Region unstable, connected, snakelike patterns

The Cahn Morral System

Van der Waals

$$E_{\varepsilon}[\vec{u}] = \int_{\Omega} \left(\frac{\varepsilon^2}{2} \cdot |\nabla \vec{u}|^2 + F(\vec{u}) \right) dx$$

The Quadratic Nonlinearity

$$F(u, v, w) = \frac{u^2 v^2 + (u^2 + v^2)(w^2)}{4}$$

◆□▶ ◆□▶ ◆∃▶ ◆∃▶ = のへで

The Quadratic Nonlinearity

$$F(u, v, w) = \frac{u^2 v^2 + (u^2 + v^2)(w^2)}{4}$$

The Logarithmic Nonlinearity

$$F(u, v, w) = 3.5(uv + uw + vw) + u \ln u + v \ln v + w \ln w$$

・ロト・日本・モト・モー・ しょうくの

Let $f(ec{u})$: $\mathbb{R}^3 o \mathbb{R}^3$ be given by,

$$f(\vec{u}) = -P\nabla F(\vec{u})$$

where,

$$Pec{u} = ec{u} - rac{\langle ec{u}, e \rangle}{3} \cdot e$$
 with $e = (1, 1, 1)$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

$$\mathcal{G} = \{(u,v,w) \in \mathbb{R}^3 : u+v+w = 1, u \ge 0, v \ge 0, w \ge 0\}.$$

where $\vec{u}(t,x) \in \mathcal{G} \ \forall \ t$

Stability Analysis

$$B = J_f(\bar{u}, \bar{v}, \bar{w})$$

$$B = J_f(\bar{u}, \bar{v}, \bar{w})$$

• if B has a positive eigenvalue, then $(\bar{u}, \bar{v}, \bar{w})$ is unstable

$$B = J_f(\bar{u}, \bar{v}, \bar{w})$$

- if B has a positive eigenvalue, then $(\bar{u}, \bar{v}, \bar{w})$ is unstable
- if B has no positive eigenvalues, then $(\bar{u}, \bar{v}, \bar{w})$ is stable
